

Shift operator:

$$E(f(x)) = f(x+h)$$

$$E(c) = c$$

$$E^2(c) = c$$

Forward difference operator

$$\Delta f(x) = f(x+h) - f(x)$$

$$(R_1) \quad \Delta(c) = 0$$

$$(R_2) \quad \Delta(x) = 1$$

$$(R_3) \quad \Delta x^2 = 2x+1$$

Δ doesn't behave like derivative operator.

Factorial polynomial:-

$$(1) \quad x^{[0]} = x^0 = 1$$

$$(2) \quad x^{[1]} = x$$

$$(3) \quad x^{[2]} = x(x-1)$$

$$x^{[2]} = x^2 - x$$

$$(4) \quad x^{[3]} = x(x-1)(x-2)$$

$$\begin{aligned} x^{[0]} &= x^0 = 1 \\ x^{[1]} &= x \\ x^{[2]} &= x(x-1) \end{aligned}$$

$$1 = x^{[0]}$$

$$x = x^{[1]}$$

$$x^2 = x^{[2]} + x = x^{[2]} + x^{[1]}$$

we want check the behavior of Δ when it is applied on factorial polynomial.

$$(1) \quad \Delta(c) = 0$$

$$(2) \quad \Delta x^{[1]} = \Delta(x) = 1$$

$$\begin{aligned} f(x) &= x^2 - x \\ \Delta f(x) &= f(x+1) - f(x) \\ &= (x+1)^2 - (x+1) - (x^2 - x) \\ &= x^2 + 2x + 1 - x - 1 - x^2 + x \\ &= x \end{aligned}$$

$$(2) \Delta x^{[1]} = \Delta(x) = 1$$

$$(3) \Delta x^{[2]} = \Delta x(x-1) \\ = \Delta [x^2 - x]$$

$$f(x) = x^2 - x \checkmark$$

$$\Delta f(x) = f(x+1) - f(x)$$

$$f(x) = f(x+1) - f(x)$$

$$= (x+1)^2 - (x+1) - [x^2 - x]$$

$$= \cancel{x^2} + 1 + 2x - \cancel{x} - 1 - \cancel{x^2} + \cancel{x}$$

$$= 2x = 2x^{[1]}$$

$$\Delta x^{[2]} = 2x^{[1]}$$

Δ behaves like derivative operator when it is applied on factorial polynomial

— X = —

Solution of non-Homogeneous recurrence relation:

Consider a recurrence relation:

$$a_{n+2} + a_{n+1} + a_n = f(n)$$

$$E^2(a_n) + E(a_n) + a_n = f(n)$$

$$(E^2 + E + 1)a_n = f(n)$$

$$\boxed{G(E) \cdot a_n = f(n)} \longrightarrow \otimes$$

$$a_n = \frac{1}{G(E)} f(n)$$

∴ This is the particular

Solⁿ of the recurrence relation.

$$* (E^2 + E + 1)a_n = f(n)$$

$$G(E)a_n = f(n)$$

$$a_n = \frac{1}{G(E)} f(n)$$

$$= C + C + C$$

$$= \boxed{3}C$$

$$= G(1)C$$

Cases

When $f(n)$ is a constant.

$$\boxed{f(n) = C}$$

$$\therefore G(E)f(n) = G(1) \cdot C$$

Case 1

When $f(n)$ is a constant

$$f(n) = c$$

$$\therefore G(E) f(n) = G(1) \cdot c$$

Consider

$$G(E) \cdot f(n) = [E^2 + E + 1] c \\ = E^2(c) + E(c) + c$$

$$\frac{1}{G(1)} f(n) = \frac{1}{G(E)} \cdot c$$

$$\frac{1}{G(1)} f(n) = \left(\frac{1}{G(E)} \cdot f(n) \right)$$

Q1) Find the P.S. of $\frac{1}{E^2 + 5E + 2} (10)$

Q2) $\frac{1}{E^2 - 5E} (100)$

Soln P.S. = $\frac{1}{E^2 + 5(E) + 2} (10)$

$$= \frac{1}{(1)^2 + 5(1) + 2} (10)$$

$$= \frac{1}{1 + 5 + 2} 10 = \frac{10}{8} = \frac{5}{4}$$

$$= \frac{1}{(1)^2 - 5(1)} (100)$$

$$= \frac{100}{-4} = -25$$

— X —

Case 2

$$(E^2 + E + 1) a_n = f(n)$$

$$G(E) a_n = f(n)$$

$$a_n = \frac{1}{G(E)} \cdot f(n)$$

$$f(n) = \alpha^n$$

$$= G(\alpha) \cdot \alpha^n$$

$$G(E) \cdot f(n) = G(\alpha) \cdot \alpha^n$$

$$G(E) f(n) = G(\alpha) \cdot f(n)$$

$$\frac{1}{G(\alpha)} f(n) = \frac{1}{G(E)} f(n)$$

Consider

$$G(E) \cdot f(n) = [E^2 + E + 1] \alpha^n$$

$$= E^2(\alpha^n) + E(\alpha^n) + \alpha^n$$

$$= \alpha^{n+2} + \alpha^{n+1} + \alpha^n$$

$\rightarrow [1, 2, \dots, n]$

$$\frac{1}{G(E)} f(n) = \frac{1}{G(\alpha)} f(n)$$

$$\left(\begin{array}{c} -\alpha + \alpha + \alpha \\ \Rightarrow [\alpha^2 + \alpha + 1] \alpha^n = \end{array} \right) \left| \frac{1}{G(E)} f(n) = \frac{1}{G(\alpha)} + (n) \right.$$

Q) Find the P.S of $\frac{1}{E^2 + 5E + 3} (2^n)$

Solⁿ P.S = $\frac{1}{E^2 + 5E + 3} (2^n)$

$$= \frac{1}{(2)^2 + 5(2) + 3} 2^n = \frac{1}{4 + 10 + 3} 2^n$$

$$= \frac{1}{17} 2^n$$

—X—

Case 3 If $f(n)$ is a polynomial ($n, n^2, n^3, n^2 + n$)

P.S = $\frac{1}{G(E)} f(n)$

$$= \frac{1}{G(1+\Delta)} \cancel{f(n)} \checkmark$$

$$= \frac{1}{G(1+\Delta)} \left[\cancel{F[n^{[1]}]} \right]$$

[Replace E by (1+Δ)]

$$f(n) = n^2$$

$$F[n^{[1]}] = n^{[2]} + n^{[1]}$$

After this, apply binomial expansion.

—X—

Case 4 $f(n) = \alpha^n n^2$

P.S = $\frac{1}{G(E)} \cdot f(n)$

$(\alpha^n n^2)$

$$= \alpha^n \left[\frac{1}{G[\alpha(1+\Delta)]} n^{[2]} + n^{[1]} \right]$$

Apply Binomial expansion,

$$\begin{aligned}
 & \overline{G(E)} \\
 &= \frac{1}{G(E)} \left(\alpha^n \cdot n^2 \right) \\
 &= \alpha^n \left[\frac{1}{G(\alpha E)} n^2 \right] \\
 &= \alpha^n \left[\frac{1}{G(\alpha(1+\Delta))} n^2 \right]
 \end{aligned}$$

Apply Binomial expansion,
then it gives you particular
 Δn .

—X—

$f(n)$	<u>P.S</u> $\frac{1}{G(E)} f(n)$
c	$\frac{1}{G(E)} (c) = \frac{1}{G(1)} c$
α^n	$\frac{1}{G(E)} \alpha^n = \frac{1}{G(\alpha)} \alpha^n$
polynomial	$\frac{1}{G(E)} f(n) = \frac{1}{G(1+\Delta)} F[n^*]$
$\alpha^n f(n)$	$\frac{1}{G(E)} f(n) = \alpha^n \frac{1}{G(\alpha(1+\Delta))} g[n^*]$
